

## Ovarian Cancer can strike a woman at any time... at any age, but the risk increases after age 45.

Each year, approximately 21,500 women will be diagnosed with ovarian cancer in the United States and approximately 15,500 women will die. If ovarian cancer is detected in its earliest stage, the five-year survival rate is over 93%.

When diagnosed in the early stages, its symptoms are often subtle and easily confused with other ailments. Research suggests that the four symptoms of bloating, pelvic or abdominal pain, difficulty eating or feeling full quickly and urinary urgency or frequency may be associated with ovarian cancer.

Ovarian cancer symptoms can also include: a feeling of fullness in pelvic or abdominal region, gas, nausea, indigestion, constipation, diarrhea, menstrual disorders, pain during intercourse, fatigue and backaches.
